Whether (Regime Station) - One-Page App Summary

Source basis: README.md, docs/architecture.md, docs/feature-specs-current.md, docs/agents/setup.md

What it is

Whether is a Next.js App Router application that turns public macro signals into operational guidance for product and engineering leaders.

It helps leadership teams decide how aggressively to operate under current funding and risk conditions.

Who it's for

Primary users: product and engineering leaders, plus COO/CFO/strategy partners who set roadmap pace, hiring posture, and risk posture.

What it does

- Detects current market climate from Treasury yield data and companion macro signals.
- Scores regime conditions and maps them to constraints and recommended operating posture.
- Presents weekly briefing and evidence views, with signals, operations, and methodology routes.
- Generates structured weekly, monthly, quarterly, and yearly summary APIs with provenance metadata.
- Supports decision tooling such as playbook actions, integration payload previews, and alert workflows.
- Uses snapshot and cache fallbacks to keep outputs available when live fetches fail.

How it works (repo-evidenced architecture)

- UI layer: Next.js App Router routes in app/ (overview, signals, operations, onboarding, methodology) call app/api/* endpoints.
- Data acquisition: lib/treasury/treasuryClient.ts fetches Treasury series; lib/macroSnapshot.ts provides macro series; data/snapshot_fallback.json backs offline fallback.
- Processing: lib/treasury/treasuryNormalizer.ts and lib/sensors.ts normalize and construct source-annotated sensor readings.
- Decision engine: lib/regimeEngine.ts scores tightness and risk appetite, then classifies regime using thresholds and overlays.
- Guidance and outputs: lib/playbook.ts, lib/decisionShield.ts, lib/report/reportData.ts, and lib/summary/* assemble recommendations and report payloads.

How to run (minimal)

- Install prerequisites: Node.js 20+ and Bun 1.3.x.
- Install dependencies: bun install
- Start local dev server: bun run dev
- Open http://localhost:3000

Gaps

Not found in repo: None for the required one-page sections above.
